

---

The geospatial revolution is well underway. Various technologies are being used to create, manage, analyze and distribute GIS data. Innovations continue to be made which provide new methods for building geographical databases and enhancements to existing methods of understanding the spatial relationships between spatially referenced data. A revolutionary tool that has emerged in the geospatial market place for building GIS data has been ermapper 7 which is not only intuitive but also provides users with the flexibility they need in order to generate geo-spatial databases that meet their specific needs. The ability of this software program also includes the ability to manage multiple projects which makes it perfect for any business or individual who wants a scalable solution. A user because of their expertise in a specific project or data set can work, track and monitor data in a GIS format. The software's database management system is known as an "embedded database". A database that has been embedded into another computer program allows the database to be managed from the same machine or from a separate computer. In addition, other applications can use other portions of the database without interfering with other projects being managed from the same computer. Some advantages to an embedded database include: The ermapper 7 comprehensive engine allows users to deal with everything from simple features such as points and lines to more complex useful features such as polygons and areas. ermapper 7 is a useful tool for researchers who want to create a map or report from their data which they have captured from various sources. Another advantage of this software includes the ability to be used by a variety of users, from novice to expert. This flexibility allows students and newbie GIS users who are just familiarizing themselves with the software have the ability to learn the program at their own pace by doing "tutorials" and participating in learning activities designed by ermapper 7's support staff. A new feature in version 7 is a tutorial series that helps users understand how certain features work so they can optimize them further. Here are some features of the software:

1. Fast processing time to load large datasets.
2. Supports both raster and vector data.
3. Can handle multiple projects at the same time.
4. Database management system allows for nested tables which make it possible to maintain links between various data sets.
5. Automatic map creation to support workflows.
6. Simple batch geocoding.
7. Advanced statistical and spatial analysis tools.
8. Powerful ability to display data on web pages using dynamic Web Map Services (WMS) and Web Feature Services (WFS).
9. Tools for users to be able to work with large geospatial datasets.
10. Very easy and intuitive interface.
11. Data quality tools available include: editable attribute table, automatic geometry processing, data validator, data importer and exporter.
12. Edit capabilities for both vector and raster data; can handle large datasets.
- 13.
